CTL Car Technical Log

A complete digital logbook for vehicles — maintenance, faults, fuel, costs, renewals, and fleet management in one bilingual mobile app.

Live on iOS App Store | ~107 production users | v2.0 — Enterprise release

What it is

CTL is an iOS app (Expo / React Native) that acts as a complete digital logbook for vehicles. It lets individual car owners, small fleets, and enterprises track everything about a vehicle's life — maintenance, repairs, faults, fuel, costs, inspections, and official renewals — in one place, with reminders, photo records, and exportable reports. It is fully bilingual (English + Arabic with right-to-left support), positioning it strongly for the Middle East market as well as global users.

Who it's for

- **Individual owners** — keep a full service and cost history for their car(s).
- **Small fleets / rental operators** — manage multiple vehicles and drivers.
- **Enterprises** — multi-user organizations with role-based access, member attribution, and fleet-wide oversight.

Core features

- **Multi-vehicle garage** — add/edit vehicles with type, details, and photos.
- **Maintenance & service history** — log services, parts, and costs.
- **Fault / malfunction log** — record issues, including dashboard warning lights by icon and color.
- **Repair history** — dedicated tracking separate from routine service.
- **Fuel tracking** — fill-ups and consumption records.
- **Cost tracking** — service-cost breakdowns and spend per vehicle.
- **Renewals & inspections** — registration/inspection expiry with typed forms.
- **Smart reminders & notifications** — upcoming service/renewal alerts.
- **Reports & export** — generate and export vehicle reports (PDF / photo export).
- **Nearby service centers** — location-based discovery of repair shops.
- **Photo attachments** — camera & library for receipts, odometer, damage, lights.
- **Tools, inspection utilities, feedback** and account/profile management.

Enterprise / fleet capabilities (v2.0)

- **Organizations** with multiple members and role-based access.
- **"Logged by [member]" attribution** on vehicle events for accountability.
- **Strict context separation** — personal vs. fleet vs. enterprise data is isolated (fault log, service history, and activity feeds switch by active organization). A deliberate product rule prevents mixing personal/fleet with enterprise data.
- **Org activity log** and fleet-wide oversight screens.

Monetization

- **Subscription tiers via RevenueCat** (in-app purchases) — free tier plus paid Fleet and Enterprise upgrades. Recurring-revenue model wired to the App Store's Paid Applications setup.

Technology & architecture

- **Frontend:** Expo / React Native (iOS), TanStack Query, i18n (react-i18next).
- **Backend:** Node/Express API with PostgreSQL; auth (incl. Clerk), organizations, vehicles, feedback, privacy endpoints.
- **Delivery:** pnpm monorepo with shared packages; shipped via EAS build !' TestFlight / App Store.
- **Localization:** English + Arabic with full RTL handling throughout the UI.

Current status & traction

- **Live on the iOS App Store** with roughly 107 production users.
- **Version 2.0.0 just cut** — a major release expanding from a single-user logbook into a multi-user enterprise/fleet platform (hence a 2.0, not a point release), currently entering on-device QA via TestFlight.

Value angles

- **Recurring revenue** already in place (subscription IAP), not just a free utility.
- **Sticky data** — the more history a user logs, the higher the switching cost.
- **MENA market fit** via first-class Arabic/RTL, a differentiator most Western competitors lack.
- **Expandable TAM** — a clear path from individual !' rental/small-fleet !' enterprise, each a higher-value customer.
- **B2B upside** — fleet/enterprise tiers open per-seat and per-vehicle pricing beyond consumer subscriptions.
